# C Programming

**Variables সংক্রান্ত  
Problem Solving**

## লোকাল Variable

```
#include <stdio.h>
int main() {
    int A = 20;
    printf("The number is: %d\n",A);

    return 0;
}
```

## গ্লোবাল Variable

```
#include <stdio.h>
int A = 20;
int main() {
    printf("The number is: %d\n",A);
    return 0;
}
```

## Data সংরক্ষণ এবং পরিবর্তন

```
#include <stdio.h>
int main() {
    int A = 10; //initializing
    printf("The value of A is:%d\n",A);
    A = 20; //update
    printf("The value of A is:%d\n",A);
    return 0;
}
```

## ফাংশনের মধ্যে দিয়ে Value পাঠানো

```
#include <stdio.h>
void printNumber(int num);
int main() {
    int x = 10;
    printNumber(x);
    return 0;
}
void printNumber(int num)
{
    printf("The number is %d\n", num);
}
```

## ফাংশনের মধ্যে দিয়ে Value পাঠানো

```
#include <stdio.h>
void printName(char* name);
int main() {
    char myName[] = "Nobel";
    printName(myName);
    return 0;
}
void printName(char* name) {
    printf("My name is %s\n", name);
}
```

## প্রোগ্রাম ফ্লো Control করা

```
#include <stdio.h>
int main() {
    int x = 10;
    if (x > 5) {
        printf("x is greater than 5\n");
    } else {
        printf("x is less than or equal
to 5\n");
    }
    return 0;
}
```

## কনফিগারেশন সেটিংস Store করা

```
#include <stdio.h>
int main() {
    int screenWidth = 800;
    int screenHeight = 600;
    float scaleFactor = 1.5;

    printf("Screen resolution: %dx%d,
Scale factor: %f\n", screenWidth,
screenHeight, scaleFactor);

    return 0;
}
```

```
#include <stdio.h>
int main() {
```

```
    printf("Thank You"
```

```
    );
    return 0;
}
```
